

I am a licensed amateur radio operator and have been for 50 plus years. I would like to caution the commission regarding the activation of the BPL system. It seems to me from a pure engineering standpoint it will generate a horrific amount of RF interference that will effect not only amateur communication but many other services as well.

I have read in detail and carefully reams of info on the subject including the test that have been performed to date. Why doesn't the FCC perform their own testing???? There is a lot of things wrong with this whole system. You don't propagate VHF signals on a 60 hertz system unless you use brute force and that is fraught with problems and my parting comment is: why has BPL been rejected by every other nation that has tried it???? Sincerely, Noel O. Kondt
